### **DETAILED ACTION**

This is the First Office Action in response to the above identified patent application filed on April 15, 2004.

#### ***Priority***

1. Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.

#### ***Claim Rejections - 35 USC § 102***

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 1, 2, 4, 6, 2/8, 4/8, 5/8, and 6/8 are rejected under 35 U.S.C. 102(b) as being anticipated by Araki et al. (USP 6,114,772) .

Araki et al. illustrates in Figure 8 a pinion gear (30) having a rotation-restricting ring (31), a rotation-restricting member (5) adapted to engage depressions of the ring, a thrust bearing (32) for absorbing friction between the ring and a member (34) for restricting backwards movement wherein the ring is formed separately from the pinion gear.

4. Claims 3 and 7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Araki et al. (USP 6,114,772) as applied to claim 1 above, and further in view of Soh (USP 6,142,028).

Araki et al. does not teach a bearing integrally formed with the rotation-restricting ring, but the prior art to Soh illustrates a bearing (17) formed integrally with the rotation-restricting ring. It would have been obvious to one of ordinary skill in the art at the time the invention was made to replace the bearing of Araki et al. with a rolling bearing being integrally formed with the rotation-restricting ring, as taught by Soh, motivation being to reduce friction between relatively rotating components with a simple and inexpensive bearing arrangement.

Araki et al. does not teach a sealing means for the bearing, but the bearing of Soh teaches a bearing (17) having a plate member (18), wherein the plate member covers the rolling bearing members so as to seal the bearing from contaminants. It would have been obvious to one of ordinary skill in the art at the time the invention was made to replace the bearing of Araki et al. with a rolling bearing having a plate member, as taught by Soh, motivation being to reduce the possibility of contaminants from entering the bearing arrangement.

***Allowable Subject Matter***

5. Claim 9 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
